1 Revision History

Revision	History
C1	Fixed Issues: <ul style="list-style-type: none"> Removed obsolete section “Confidential”
C	Fixed Issues: <ul style="list-style-type: none"> #684: Documentation: ExtApi Specification rev B has explanation of ESO Fault Codes in SSO section.
B	New Features: <ul style="list-style-type: none"> Added time stamps to data payloads Improved handling if charge/discharge requests as well as an updated explanation. Fixed issues: <ul style="list-style-type: none"> #652: Documentation: Update ExtApispec with explanation of fault codes for system, sso, eso #651: Documentation: ExtApi spec has incorrect unit on sext #645: ExtApi does not handle ESOs in master/slave configuration correctly #409: ESM data has flipped soc and soh (from extapi version 1.1.1) #388 : Extapi does not report system level SOC/SOH/Rated Capacity
PB1	Available currents. Separate branch not described here
A1	Updated section 4.1
A	First formal release of specification

2 Disclaimer

The Ferroamp External API implementation is in beta release state and compatibility between different versions of this document is not guaranteed.

3 Connection

Data and commands are sent using mqtt where the user connects to the mqtt broker residing on the Ferroamp system.

Ip: address to unit
Port: 1883
Encrypted port: 8883

3.1 Encryption

Data shall be encrypted but for the moment we will use user/password.

User: to be sent separately
Password: to be sent separately

4 Data

Data is published from a ferroamp system and may contain measurement data and system status. Data is sent periodically using mqtt.

Topics:

- extapi/data/ehub
- extapi/data/eso
- extapi/data/sso
- extapi/data/esm

Payload: json formatted data.

4.1 Payload specification

The payload is in json format specified as follows:

```
{ "parameter_name_1": { "value_representation_1" }, { "parameter_name_2":
{ "value_representation_2" }, ... "parameter_name_n":
{ "value_representation_n" }
```

The parameters can be required or optional. Optional may not be sent at all or sent intermittently

4.1.1 Definitions

In the tables below the following abbreviations are used

Abbreviation	Meaning
<string>	ascii formatted string
<str_fl>	String representation of a float, i.e. "3.141528"
<str_uint8>	String representation of an unsigned 8-bit integer, i.e. "1"
<str_uint16>	String representation of an unsigned 16-bit integer, i.e. "514"
<str_uint32>	String representation of an unsigned 32-bit integer, i.e. "410123"
<str_uint64>	String representation of an unsigned 64-bit integer "2454683685"

4.1.2 extapi/data/ehub

Transmission interval: 1s

Parameter name	Value representation	required	Unit of measurement	Comment
'gridfreq'	{ "val":<str_fl> }	no	Hz	
'ul'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	V	External voltage
'il'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	Inverter RMS current
'ild'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	Inverter reactive current
'ilq'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	Inverter active current
'iext'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	External/grid RMS current
'iextd'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	External/grid reactive current
'iextq'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	External/grid active current
'iLoadd'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	
'iLoadq'	{ "L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl> }	yes	A	
'soc'	{ "val":<str_fl> }	yes	%	State Of Charge for the system
'soh'	{ "val":<str_fl> }	yes	%	State Of Health for the system
'sext'	{ "val":<str_fl> }	yes	VA	apparent power

'pext'	{"L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl>}	yes	W	external/grid power, active
'pextreactive'	{"L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl>}	yes	W	external/grid power, reactive
'pinv'	{"L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl>}	yes	W	inverter power, active
'pinvreactive'	{"L1":<str_fl>,"L2":<str_fl>,"L3":<str_fl>}	yes	W	inverter power, active

```

4.1.3 extapi/data/eso

Transmission interval: Default 5s. Configurable between 1 and 30 seconds.

Parameter name	Value representation	required	Unit of measurement	Comment
'id'	{"val":<string>}	yes		Unique identifier
'ubat'	{"val":<str_fl>}	yes	V	Measured on battery side
'ibat'	{"val":<str_fl>}	yes	A	Measured on battery side
'wbatprod'	{"val":<str_uint64>}	yes	mJ	Total energy produced by ESO, i.e total energy discharged
'wbatcons'	{"val":<str_uint64>}	yes	mJ	Total energy consumed by ESO, i.e total energy charged
'soc'	{"val":<str_fl>}	yes	%	State of Charge for ESO
'relaystatus'	{"val":<str_uint8>}	yes		0 = relay closed 1 = relay open
'temp'	{"val":<str_fl>}	yes	degrees Celsius	Measured on PCB
'faultcode'	{"val":<str_uint16>}	yes	bitmask	0x00 = OK, battery manufacturer is Ferroamp 0x80 = OK, battery manufacturer is other than Ferroamp For all other values please contact Ferroamp support
'ts'	{"val":<string>}	yes	Format: "YYYY-MM-DDThh:mm:ssUTC"	Time stamp when message was published.

4.1.3.1 Example

```
{
  "faultcode": {
    "val": "0"
  },
  "id": {
    "val": "17080008"
  }
  "ibat": {
    "val": "1.00"
  },
  "ubat": {
    "val": "470.0"
  },
  "relaystatus": {
    "val": "1"
  },
  "soc": {
    "val": "100.0"
  },
  "temp": {
    "val": "24.47"
  },
  "wbatcons": {
    "val": "1027307459944"
  },
  "wbatprod": {
    "val": "1027307459944"
  },
  "ts": {
    "val": "2019-01-18T14:23:10UTC"
  }
}
```

4.1.4 extapi/data/sso

Transmission interval: Default 5s. Configurable between 1 and 30 seconds.

Parameter name	Value representation	required	Unit of measurement	Comment
'id'	{"val":<string>}	yes		Unique identifier of SSO
'upv'	{"val":<str_fl>}	yes	V	measured on PV string side
'ipv'	{"val":<str_fl>}	yes	A	measured on PV string side
'wpv'	{"val":<str_uint64>}	yes	mJ	Total energy produced by SSO
'faultcode'	{"val":<str_uint16>}	yes	bitmask	0x00 = OK For all other values please contact Ferroamp support
'relaystatus'	{"val":<str_uint8>}	yes		0 = relay closed (i.e running power) 1 = relay open/disconnected 2 = precharge
'temp'	{"val":<str_fl>}	yes	degrees Celsius	Temperature measured on PCB of SSO
'ts'	{"val":<string>}	yes	Format: "YYYY-MM-DDThh:mm:ssUTC"	Time stamp when message was published.

4.1.4.1 Example

```
{
  "relaystatus": {
    "val": "1"
  },
  "temp": {
    "val": "24.47"
  },
  "wpv": {
    "val": "1027307459944"
  },
  "faultcode": {
    "val": "0"
  },
  "ipv": {
    "val": "0"
  },
  "upv": {
    "val": "0.43"
  },
  "id": {
    "val": "17080008"
  }
  "ts": {
    "val": "2019-01-18T14:23:10UTC"
  }
}
```

4.1.5 extapi/data/esm

Transmission interval: Default 60 s. Configurable between 1 and 300 seconds.

<i>Parameter name</i>	<i>Value representation</i>	<i>required</i>	<i>Unit of measurement</i>	<i>Comment</i>
'id'	{"val":<string>}	yes		Unique identifier of ESM
'parenteso'	{"val":<string>}	yes		ESO id to which the ESM is connected
'soh'	{"val":<str_fl>}	yes	%	
'soc'	{"val":<str_fl>}	yes	%	
'ratedCapacity'	{"val":<str_fl>}	yes	Wh	Rated capacity of battery
'ts'	{"val":<string>}	yes	Format: "YYYY-MM-DDThh:mm:ssUTC"	Time stamp when message was published.

4.1.5.1 Example

```
{
  "soh": {
    "val": "100.0"
  },
  "soc": {
    "val": "100.0"
  },
  "ratedCapacity": {
    "val": "7200.0"
  },
  "id": {
    "val": "17020004"
  },
  "parentesoid": {
    "val": "17070001"
  }
  "ts": {
    "val": "2019-01-18T14:23:10UTC"
  }
}
```

5 Control

To control the ferroamp system publish a message on the topic /extapi/request. The system will validate the settings, execute them if possible and return the changed settings on topic /extapi/result. The system only allows for one request at a time until the whole sequence of request-response-result is done no new requests will be acted upon. If a new request is sent before the current is finished the ehub will return a NAK and a message stating that a request/transaction is already in progress.

Topics:

- extapi/control/request
- extapi/control/response
- extapi/control/result

5.1 Request

Request payload is on json format and has two predefined keys:

```
{"transId":<str>,"cmd":{cmdValue}}
```

Parameter name	Value representation	required	Comment
'transId'	<string>	yes	Unique identifier of transaction (i.e. incremented integer, UUID)
'cmd'	{<name>:<string>,<arg_1>:<value_1>,... {<arg_n>:<arg_n>}}	yes	Command data in json format. Contains one or more key-value pairs. See specification below

Below is a list of supported requests and their arguments

Command name	Value representation	Argument1 name	Argument 1 repr	Comment
'charge'	<string>	"arg"	<string>	arg is charge power in W
'discharge'	<string>	"arg"	<string>	arg is discharge power in W
'auto'	<string>	N/A	N/A	No argument needed
'extapiversion'	<string>	N/A	N/A	No argument needed. Version no is returned in response, no result sent

Future commands to be added as needed, e.g. "soclimits"

5.1.1 Examples of request payloads

5.1.1.1.1 Charging with 5000W:

```
extapi/control/request {"transId":"1",
cmd":{"name":"charge","arg":"5000"}}
```

5.1.1.1.2 Discharging with 12 kW:

```
extapi/control/request {"transId": "1508459760", "cmd":{"
name":"discharge","arg":" 12000"}}
```

5.1.1.1.3 Returning control of batteries to system:

```
extapi/control/request {"transId": "989C6E5C-2CC1-11CA-A044-
08002B1BB4F5", "cmd": {"name": "auto"}}
```

5.1.2 Power reference/argument in charge and discharge requests

The argument is power reference for the system and not the power reference of each respective battery.

When received the system will evaluate the current rated capacity and maximum charge/discharge power limits of the system. Depending on the status reported by ESOs and batteries the current rated capacity and power limits may differ from the system's nominal capacity and power limits. For instance, if one battery is not available due to a fault the current rated capacity and power limits of the system will be reduced by the nominal capacity and power of that battery.

5.2 Response

Response carries data on the status of the request and, if possible, and explanation on the status. The response and status are sent directly as a response to request and shall be seen as an indication of whether the request is applicable or not. If applicable the result of the actual request will be sent in a "result" topic, see 5.3 below. transId value will be the same as in the corresponding request payload.

Examples:

```
{"status": "ack", "msg": "sending cmd to ESOs", "transId": "1"}
```

```
{"status": "nak", "msg": "Other transaction in progress", "transId": "128"}
```

```
{"status": "nak", "msg": "Max allowed power is 24000 W", "transId": "311"}
```

5.3 Result

Carries the information on the result of the request. It is sent asynchronously when the request has been executed. transId value will be the same as in the corresponding request payload.

```
{"transId":<string>, "status":<ack/nak>, "msg": <string>}
```

6 Events

To be implemented

The ferroamp system has the possibility to publish event data on asynchronous events.

Topics:

- extapi/control/event/ {"timestamp":utc date, "event": {<string>}}
